

Tips for Preventing Falls

Preventing Falls Is Important

Each year about one-third of all people age 65 and older will fall. Preventing falls is important for older people and anyone with osteoporosis. If you have osteoporosis, you are more like to break a bone from a fall, especially in your hip, spine or wrist. A broken bone is also called a fracture. Most hip fractures are associated with osteoporosis and the majority of hip broken bones in older people happen after a fall. Broken bones can limit your ability to lead an active, independent and pain free life.

Many of us face winters with shorter days, cold temperatures, snow and ice. While this weather can be dangerous for anyone, it is a special concern for people with osteoporosis. In addition to having fragile bones, older people often lose much of the muscle and body fat that help to cushion and protect the bones. Loss of padding in the hip area may make the hip more likely to fracture.

Luckily you can help prevent falls by giving attention to safety both indoors and outside, by being aware of physical changes with advancing age and by engaging in appropriate lifestyle behaviors.

Outdoor Safety Tips

- Wear low-heeled shoes with rubber soles for added traction, and wear warm boots in winter.
- Use hand rails as you go up and down steps and on escalators.
- If sidewalks look slippery, walk in the grass for better traction.
- In winter, carry a small bag of rock salt, kosher salt or kitty litter in your pocket or car. You can then sprinkle the salt or kitty litter on sidewalks or streets that are slippery.
- Look carefully at floor surfaces in public buildings. Many floors are made of highly polished marble or tile that can be very slippery. When these surfaces are wet, they may become dangerous. When floors have plastic or carpet runners in place, stay on them whenever possible.
- Keep your porch, deck, walkways and driveway free of leaves, snow and debris and keep them in good repair.
- Cover porch steps with a gritty, weather-proof paint.
- Turn on the porch light before leaving your home in the early evening so that you have outdoor light when you return after dark.
- Use a shoulder bag, fanny pack or back purse to leave your hands free.
- Use a walker or cane as needed for added stability.
- Identify community services that can provide assistance, such as 24-hour pharmacies and grocery stores that take orders over the phone and deliver, especially in poor weather.
- Stop at curbs and check the height before stepping up or down. Be cautious at curbs that have been cut away to allow access for bikes or wheelchairs. The incline may lead to a fall.
- Consider wearing hip protectors or hip pads for added protection should you fall.

Tips for Preventing Falls

Indoor Safety Tips

- Keep all rooms free from clutter, especially on the floors.
- Keep floor surfaces smooth but not slippery.
- Wear supportive, low-heeled shoes inside and outside your home. Avoid walking around in socks, stockings and slippers.
- Check that all carpets or area rugs have skid-proof backing or that they are tacked to the floor, including the carpeting on stairs.
- Keep all stairwells well lit with handrails on both sides. Consider placing fluorescent or brightly colored tape on the edges of the top and bottom steps.
- Keep electrical cords and telephone lines out of walkways.
- Install grab bars on bathroom walls beside tubs, showers and toilets. If you are unstable on your feet, consider using a plastic chair with a back and nonskid leg tips in the shower.
- Use a rubber bath mat in the shower or tub.
- Keep a flashlight with fresh batteries beside your bed and consider placing a night light in your bedroom and/or hall.
- Use at least 100 watt bulbs in your home to have ample light.
- Add ceiling fixtures to rooms lit by lamps only, or install a lamp that can be turned on by a switch near the room entrance. Another option is to install voice or sound activated lamps.
- Reorganize work areas and storage to minimize the need for stooping or excessive reaching. If you must use a stepstool, make sure that it is sturdy and has a handrail and wide steps.
- Avoid sitting in chairs that have wheels.
- Make certain that the nighttime temperature in your home is not lower than 65 degrees. Prolonged exposure to cold temperatures may cause body temperatures to drop, leading to dizziness and falling. Many older persons cannot tolerate cold as well as younger people.
- Use caution in getting up too quickly after eating, lying down or resting. To help avoid dizziness when getting out of bed, sit on the side of the bed for a minute or two before getting up and standing.
- Consider purchasing a portable phone that you can take with you from room to room. It provides security because not only can you answer the phone without rushing for it, but you can also call for help should an accident occur.
- Arrange with a family member or friend for daily contact. Always have at least one person who always knows where you are.
- Give some thought to contracting with a monitoring company that will respond to your call 24 hours a day if you live alone.

Tips for Preventing Falls

Physical Changes

As we age, we tend to experience changes in our reflexes, balance, hearing and vision. These changes can lead to falls. So can having certain illnesses and taking certain medicines. Here some explanations of these changes as well as some tips that can help you reduce the chances of falling:

Reflexes. Reflexes are automatic responses to stimuli in the environment. Examples include slamming on your car brakes when a child runs into the street or moving out of the way quickly when something falls in front of you. As you age, your reaction time slows and regaining your balance following a sudden movement may be difficult. This decreased ability to control your movements can result in a fall.

To improve body control, keep up an active lifestyle. Activity maintains muscle tone and flexibility and slows bone loss. Regular weight-bearing exercises and weight training can build and tone muscles even in older persons. Keeping up the strength in your arms and legs can go a long way to improving how well you move. Talk to your healthcare provider about activities that are safe and beneficial for you, keeping in mind your individual situation.

Balance. Improving your balance helps to prevent falls. There are several ways to enhance your balance. Consider joining a class or group that practices Tai Chi. It is an exercise that can improve balance and coordination. Lack of exercise not only robs your bones of density, but it can lead to muscle weakness, which increases your risk of falling. Here are some additional tips to help with balance:

- Do muscle-strengthening exercises.
- Make sure you have maximum vision correction and practice exercising with your bifocal or trifocal glasses.
- Stay informed about the side effects of your medicines and follow the instructions for taking them.
- Do balance exercises regularly.

Balance exercises to practice:

- While holding the back of a chair or counter top, practice standing on one leg at a time for a minute. Gradually increase the time. Then try balancing with your eyes closed. And, then try balancing without holding on.
- While holding the back of a chair or counter top, practice standing on your toes. Then rock back to balance on your heels. Hold each position for a count of 10.
- While holding the back of a chair or counter top with both hands, make a big circle to the left with your hips. Then repeat to the right. Do not move your shoulders or feet. Repeat five times.

Hearing. Changes in hearing occur as we age. Sounds around us help orient us to where we are and when we are in danger. If you do not hear as well as you used to, or if you are always asking those around you to repeat themselves, it is time to have a hearing test. If you have hearing loss, be sure to wear a hearing aid.

Tips for Preventing Falls

Vision. Vision also changes with age. Cataracts or glaucoma can develop. Your eyes may take longer to adjust to changes in the light and glare. Changes in depth perception or peripheral vision can decrease your ability to judge the steepness of stairs and curbs or to avoid obstacles in your path. Have regular eye exams, and if needed, wear prescription glasses or contact lenses.

Illnesses and Medication. Some people have illnesses that affect circulation, sensation or mobility. Stay informed about your medical conditions. Certain medications, such as blood pressure pills, heart medicine, diuretics, sleeping pills, sedatives, antidepressants, muscle relaxers and tranquilizers, can cause confusion, dizziness, disorientation and slowed reflexes. Talk to your healthcare provider or pharmacist about the side effects of the drugs that you take and how they may affect your coordination or balance. Be aware that the use of multiple medicines can increase your risk of falling. Never change or skip medications without first talking with your healthcare provider.

Lifestyle Behaviors. Certain lifestyle behaviors can make a person more susceptible to a fall, for example:

- Alcohol slows reflexes and may cause confusion, dizziness or disorientation.
- People in a hurry need to slow down. Accidents are more likely to happen when you do things in haste.
- It's important to stay alert and focused when in public places.
- Exercising regularly helps maintain bone density. A physical therapist can help you develop a safe and appropriate exercise program.
- Physical training can increase muscle strength and size which helps to support the bones and prevent injury.
- If you need glasses, wear them.
- If you need a hearing aid, use it.
- Remember to wear appropriate shoes both indoors and out.
- Good nutrition with an adequate daily intake of calcium and vitamin D are important for bone health at all ages.

Summary

Taking precautions inside and outside your home as well as in your daily routine can help you prevent falls and broken bones. These measures can also help you lead an active and productive life.
